

Portfolio Research & Activity Log

Subash Lama - auto-generated journal

3 recorded day(s)

2026-07-04

Session 01:17

- Started tracking from this session (baseline set).

Research notes

- Reviewed the portfolio's SubashBot AI chatbot (cloudflare-worker/chat-worker.js): confirmed it does live intent-based OSINT lookups (CVE/NVD, IP reputation via AbuseIPDB, DNS resolution, Wayback Machine history, weather, sports predictions, resume/JD keyword optimization) on top of a Claude/Llama-based Q&A layer about Subash's background.

- Built a new activity-logging system per Subash's request: a ``scripts/log-session-start.py`` hook script that stamps a dated entry under ``activity-log/entries/``, records git commits/diff-stat since the last session, and regenerates a cumulative PDF via ``scripts/generate-activity-report.py`` (fpdf2-based).

- Decided against a fragile "call Claude headlessly from the hook" design for the narrative portion; instead the hook handles objective git facts automatically and deterministically, while narrative/research notes get added by the assistant directly during sessions ? more reliable and richer than a cold automated summary.

Session 01:19

- No new commits since the last session.

2026-09-09

Session 11:11

- Commits:
- d45a413 chore: update CVE watchlist 2026-09-08
- 5a67efd chore: daily stats update 2026-09-08
- c79565d chore: update security headlines 2026-09-08
- 563c19d chore: update CVE watchlist 2026-09-07

Research notes

Returned to the project after roughly two months away and ran a full status audit rather than any new feature work.

****Findings ? repo cadence.**** Real feature work stopped at ``29bc9be` / `ccc52e1`` (2026-07-04, the workflow YAML repair + activity journal). Everything since is machine-generated: ~216 ``chore:`` commits from the scheduled workflows, three Dependabot bumps, and one README touch on 2026-09-03. The commit graph looks busy but no human decisions were made in it.

****Findings ? CI health.**** Scanned the last 200 workflow runs. The 2026-06-26?07-03 cluster of ``.github/workflows/*.yml``-named failures is dead history, cured by the July 4 YAML fix. Three failures are still live:

1. ***Evening Recap*** ? 75 failures, daily since 2026-06-26. Root cause found in ``evening-recap.yml:45`` and ``:47``: ``TC=$(grep ... | awk ... )`` under the runner's default ``bash -e -o pipefail``. On any day with zero downloads the leading ``grep`` exits 1, `pipefail` propagates it, and ``set -e`` kills the step before a single line of output. Lines 43?44 are guarded with ``|| echo 0``; 45 and 47 were missed.
2. ***Weekly Referrer Intelligence*** ? 10 failures, weekly since 2026-07-03. Same class, different line: ``referrer-analysis.py`` correctly prints ``total=0`` and exits 0, but ``BREAKDOWN=$(echo "$ANALYSIS" | grep -v "^total=")`` then matches nothing, exits 1, and trips ``set -e`` ? before the ``if [ "$TOTAL" -eq 0 ]`` guard two lines below ever gets to skip the run.
3. ***Monthly Keyword Gap*** ? 3 failures, every 1st since 2026-07-01. Log shows "Telegram message sent." then exit 1, i.e. ``keyword-gap.py`` reached its ``except HTTPError`` branch and pushed the real error code to Telegram. Sub-second failure points at auth, not timeout ? ANTHROPIC_API_KEY likely expired or out of credit since the 2026-06-24 setup.

All three share one shape: they were written and tested against a **populated** download log, and started failing once the data went quiet. Worth remembering as a pattern ? these aren't three bugs, they're one assumption.

****Findings ? resume pipeline.**** The live site still serves the 2026-06-26 CV (113,211 bytes, verified over HTTP). A newer ``Subash_Lama_CV.pdf`` (92,091 bytes)

has been sitting uncommitted in `content/resume/` since 2026-07-08, so CI never saw it. Also noted a landmine: `sync-resume.ps1:51` picks the *newest* PDF by timestamp, and the untracked `Subash\_Lama\_CV\_International.pdf` is six minutes newer ? committing both as-is would silently publish the international variant as the public download.

Other. `resume-downloads.txt` has logged nothing since 2026-06-20, which is either genuinely no traffic or a broken Worker?dispatch path ? not distinguishable without a live test download. Three Dependabot PRs open since July. One high-sev `brace-expansion` advisory in the dev-only toolchain.

Research notes ? remediation pass

Acted on the audit above. Everything below was verified by execution, not by reading.

Zero-download guards (committed as `6dd53d5`). Rewrote the stats block in `evening-recap.yml` to capture today's log lines once into `TODAY\_LINES`, then guard every derived substitution with `|| true`. Added the missing `|| true` to the `BREAKDOWN=` line in `referrer-intelligence.yml`. Proved causality rather than assuming it: extracted each step's shell body straight out of the YAML, ran the pre-fix version under the same `bash -e -o pipefail` the runner uses and reproduced exit 1 with zero stdout (matching CI exactly), then ran the post-fix version and got exit 0. Also exercised the happy path with a synthetic 3-download day ? correctly reported 3 downloads, 3 HOT leads, Microsoft, US.

A third bug surfaced during that testing. `referrer-analysis.py` bucketed the literal string "direct" into "Other", because line 23 only mapped empty/none/- to "direct" and never the word itself. 6 of the 16 real log rows are literally "direct" ? so the largest single referrer category has always been mislabelled. Fixed by lowercasing and adding "direct" to the match set.

The stale CV was an architecture bug, not forgetfulness. `ci.yml:26` and `build.yml:26` both run `sync-resume.ps1`, but both check out with `contents: read` + `persist-credentials: false` and only upload artifacts ? nothing commits the synced PDF back. Cloudflare Pages serves `public/` straight from git, so CI's resume sync has never once affected the live site. The README claimed otherwise; corrected it.

Wrote `publish-resume.yml` to actually close this: on push touching `content/resume/\*\*`, it syncs and commits the published PDF back as lamasubash107@gmail.com. Path filter is `content/resume/\*\*` while the commit only touches `public/`, so it cannot retrigger itself.

A trap found before it fired. Was about to wire that workflow up when I checked what `sync-resume.ps1` would actually select in CI. Its "newest wins" rule sorts on `LastWriteTimeUtc` ? but a fresh git checkout stamps every file with the checkout time, collapsing the sort to the alphabetical tiebreak on line 53. Alphabetically first is `Subash\_Lama\_CV.backup.pdf`. So the naive version of this workflow would

have published the backup CV to the live site. Two fixes: an exclusion pattern in `sync-resume.ps1` so backup/bak/old/draft/copy files can never be candidates, and a step in the workflow that replays each PDF's git commit date onto its mtime before sorting, so "newest" means genuinely newest. Verified both by running the script against a temp source dir with all mtimes forced identical.

****Dependabot.**** Merged #21 (fetch-metadata v2 to v3) and #23 (setup-node v4 to v7), both fully green across all 7 checks. Held #20 (action-send-mail v3 to v18): a 15-major jump, used only by `log-download.yml` and `log-ghost-hit.yml`, whose GMAIL_APP_PASSWORD was never set ? so it is inert today and the upgrade is pure risk.

****Still open, needs Subash.**** The monthly keyword-gap failure is an Anthropic API auth problem (log shows "Telegram message sent." then exit 1 in under a second, i.e. the `except HTTPError` branch) ? the real error code was pushed to his Telegram on 2026-07-01, 08-01 and 09-01. Cannot be fixed from here; the key needs rotating. Likewise the download log has been silent since 2026-06-20, which no amount of code reading can distinguish between "no traffic" and "broken Worker dispatch" ? that needs one real test download.

Research notes ? tracking repair and push

Subash's actual goal surfaced late: he wants visitor + CV-download tracking to work. Chasing that changed the priorities entirely.

****The real defect was in the frontend, not the pipeline.**** The worker, the GitHub dispatch, the log append and the commit were all fine. But `site.js` bound the download tracker with `document.querySelector("[data-resume-download]")` ? singular ? and only 1 of the 5 CV links in `index.html` carried that attribute. The other four were plain `` tags: the browser fetched the PDF directly from Pages and the worker was never called. So the prominent "Download CV" button in the hire section, the footer link, the recruiter-modal button and the inline text link were all silent.

Checked whether this was a regression before assuming: walked 15 revisions of `index.html` and it has been 1-of-5 (earlier 1-of-4) since June. Never a regression ? the one hooked button is simply how June 20's downloads got through. Subash's memory that "it was working" was correct but partial.

Fixed by hooking all five links and switching to `querySelectorAll` + `forEach`. Verified with a Node harness that extracts the real `initResumeTracking` from site.js by brace-matching and runs it against a stubbed DOM with `fetch` intercepted ? deliberately stubbed so nothing reached the live worker. Old code: 5 links, 1 handler, 1 dispatch. New code: 5 links, 5 handlers, 5 dispatches, each a well-formed `resume-download` event. (Harness gotcha worth remembering: Node 24 defines `navigator` as a read-only global, so `global.navigator = {...}` is silently ignored ? needs `Object.defineProperty`.)

****Second defect: the alert itself.**** `log-download.yml` pasted the message into a

JSON string literal. It contains real newlines, so the payload was invalid JSON ? reproduced locally as "Invalid control character at line 1 column 55" ? and Telegram rejected the last real download with `ok:false`. The step never inspected the response, so it reported success. Switched to the `json.dumps` + ok-check pattern the other senders already use, and verified it survives a hostile org field containing both a quote and a backslash.

****Corrected an earlier claim.**** I had said the failing email step was what turned those runs red. Wrong ? `continue-on-error: true` was already added on June 23; that was true only of the pre-fix June 20 run.

****Deliberately did NOT touch `OWNER\_ORGS`.**** The stale `VIA NET` filter no longer matches his connection, which now reports "Dynamic allocation for Broadband Subscribers". Tempting to just add that string, but it is a generic Nepali broadband descriptor that would very likely match real visitors too and silently discard genuine recruiter downloads. Leaving the filter non-matching means nothing is dropped, which is exactly what he wants right now. Flagged for his decision.

****Pushed**** six commits, then the new `publish-resume.yml` fired on its first real run and behaved exactly as simulated: restored the CV's mtime from git (09:22:17 UTC), synced, and committed the one-line manifest timestamp correction as `e7401e4`, authored correctly as Subash. All seven push-triggered workflows green. Live site now serves the AI Security Engineer CV (8,690 bytes, "Waft" present), with 5 tracking hooks and `querySelectorAll` confirmed in the deployed JS.

****Also noticed:**** something in this environment runs `git pull origin main --quiet` on its own ? it appears twice in the reflog and explains two "why did local move?" moments. Worth knowing before diagnosing sync confusion again.

****Still open, needs Subash:**** rotate ANTHROPIC_API_KEY; decide on OWNER_ORGS; realign site positioning (page still says "Cybersecurity Analyst | SOC · GRC · IAM" while the CV leads with AI Security Engineer); correct the 7 fictitious certs hardcoded in `keyword-gap.py`; and above all ? do one real download from mobile data to prove the whole chain end to end.

Research notes ? the actual root cause

Subash downloaded his CV and no alert arrived, which was the right test to run: my frontend fix was necessary but not sufficient.

****Bisected from the outside in.**** No repository_dispatch had reached GitHub at all, so the break was upstream of Actions. POSTed a synthetic resume-download to the Worker: got 403. That was my error, not a bug ? worker.js:19 keeps an ALLOWED_ORIGINS list and a bare curl sends no Origin. Retried with `H "Origin: https://subashlamaprofile.pages.dev"` and got ****502 "GitHub error"**,** which localised the fault precisely: the Worker is reached, enriches fine, and GitHub refuses the dispatch.

First hypothesis was an expired GITHUB_PAT. Checked GITHUB_REPO first (``Subash107/SubashLamaProfile``, correct ? he has an old-origin remote pointing at a now-deleted repo, so this was worth ruling out). Then dispatched with his own gh CLI credential to isolate token from pipeline, and GitHub answered:

422 ? No more than 10 properties are allowed; 13 were supplied.

****That is the whole thing.**** ``repository_dispatch`` caps `client_payload` at 10 properties. `site.js` sent 9 flat fields; `worker.js:951-956` adds 6 more (ip, location, org, lead_score, anon_flag, repeat). 15 total, rejected every time since the June 24 Worker change added lead_score/anon_flag/repeat. The Worker returns 502 to the browser, the browser ignores it, and nothing anywhere records a failure. Completely silent for 11 weeks.

Not the PAT at all. Worth remembering how close I came to blaming the credential ? the isolation dispatch is what settled it, and it cost one request.

****Fix without touching the Worker.**** Only telegram-bot.js has a deploy workflow; worker.js needs a manual ``wrangler deploy``, which I cannot do. So the fix had to live in site.js + the workflow: pack the page's 9 fields into 3 (``client`` = `ts|os|browser|device|tz|lang, `referrer`, `utm`` = `source|medium`) for a total of 9, and unpack with ``IFS=|`` read. The Worker's 6 are immovable, so the page's budget is 4 properties forever ? noted in memory.

****Also closed a script-injection hole while in the file.**** Every step interpolated ``${{ github.event.client_payload.* }}`` directly into ``run:`` blocks. Those values are caller-supplied, and the Origin allowlist is only enforced by browsers ? I set the header by hand from curl minutes earlier. A crafted referrer would have executed in his runner with contents:write. Moved the whole payload into ``env:`` and switched the steps to shell variables. Renamed the unpacked tz/lang to TZ_NAME/LANG_TAG because TZ and LANG are meaningful to the shell.

****Verified end to end, not assumed.**** 13 properties ? 422. 10 ? 204, workflow ran, Telegram delivered (message_id 1209). After deploying the packed payload, a browser-shaped POST through the Worker returned 200 (was 502), the workflow unpacked ``os=Windows 11/10 browser=Chrome device=Desktop utm=diagnostic``, and Telegram delivered message_id 1211. Removed both diagnostic rows from resume-downloads.txt afterwards ? 18 lines back to the 16 genuine ones.

Still unverified from his side: a real download from a real phone. Everything I can reach now works.

Session close ? state and next steps

Working tree clean, in sync with origin, 12 commits pushed today.

****Done and verified today****

- Evening Recap and Weekly Referrer Intelligence: zero-download guards fixed (75 and 10 consecutive failures respectively). Proven by running the extracted step under the runner's own ``bash -e -o pipefail``: exit 1 before, exit 0 after.

Subash Lama - Portfolio Research & Activity Log

- Resume download tracking: two independent faults, both fixed.

(a) only 1 of 5 CV links was hooked ? now 5 of 5, proven with a stubbed-DOM harness (1 dispatch before, 5 after);

(b) the 15-property client_payload exceeded GitHub's 10-property cap and every dispatch was 422'd since June 24 ? now packed to 9. Verified end to end:

Worker returned 200 (was 502), workflow unpacked correctly, Telegram delivered message_id 1211.

- Telegram alert JSON encoding + delivery verification in log-download.yml.
- Script-injection hole closed: client_payload no longer interpolated into run:.
- CV auto-publish workflow live; the AI Security Engineer CV is on the site.
- Referrer "direct" labelling; brace-expansion advisory; Dependabot #21 and #23.
- Bot visitor tracking confirmed live (botCount 0 -> 1 on a test /visit).

****Next session ? start here****

1. The one thing still unproven: a real download from a real browser. Load <https://subashlamaprofile.pages.dev> (the homepage, NOT the PDF URL), hard-refresh so the cached site.js is replaced, let it load, then click Download CV. Expect a Telegram alert in ~30s and humanCount 1 at /daily-stats. Opening the PDF URL directly runs no JavaScript and tracks nothing ? that is the likely reason the earlier test produced silence even after the fixes.
2. Rotate ANTHROPIC_API_KEY ? keyword-gap has failed every 1st since July; the real error code is in Telegram from Jul 1 / Aug 1 / Sep 1. Next failure Oct 1.
3. Site vs CV mismatch ? the page still sells "Cybersecurity Analyst | SOC / GRC / IAM" with zero mention of Waft, AI security or LLM red-teaming, while the CV now leads with all of it. Biggest remaining piece of work and a content decision.
4. scripts/keyword-gap.py hardcodes 7 certifications he does not hold (CompTIA x3, eJPT, ISC2 CC, Wazuh CE). The website is honest about these ? only the script is wrong. download-logs/cert-expiry.json is the accurate source.
5. worker.js:25 OWNER_ORGS still filters "VIA NET", which no longer matches his connection ("Dynamic allocation for Broadband Subscribers"). Deliberately left alone: that string is a generic Nepali broadband descriptor and would likely discard real visitors. Decide between filtering by IP or dropping the filter.
6. PR #20 (action-send-mail v3 -> v18) still open. Recommend closing ? 15 major versions, and the email path needs GMAIL_APP_PASSWORD which is deliberately unset.

****Constraints worth not rediscovering****

- repository_dispatch allows at most 10 client_payload properties. The Worker contributes 6, so the page may never send more than 4.
- worker.js has no deploy workflow (only telegram-bot.js does). Changing it needs a manual `npx wrangler deploy worker.js`; prefer fixes in site.js and workflows.
- /config, /.env, /admin, /login, /wp-admin, /bot-trap and /canary are honeypots. Probing them alerts Telegram and writes a KV security event. Use /daily-stats, /cia-data, /last-incident or /weekly-report for liveness checks, and send `H "Origin: <https://subashlamaprofile.pages.dev>"` or the Worker answers 403.

Subash Lama - Portfolio Research & Activity Log

****Residue from my own testing**** (both self-expiring, no action needed)

- botCount 1 for 2026-09-09 from the /visit test ? 24h TTL.
- One false-positive HIGH "Configuration Discovery" security event from a /config liveness check at 09:01 UTC ? 14-day TTL, clears by 2026-09-23. It will appear in the weekly CIA report; it was me, not an attacker.

- No new commits since the last session.

Research notes

Worked through the open-items list from 2026-09-09. Added an "AI Security / LLM Red-Teaming (Freelance)" entry to the hero's typing-role rotation on the homepage, and while there found the rotation logic had an off-by-one bug that kept it stuck on the first role forever ? fixed by starting `charIdx` at 0 instead of the full string length. Corrected `scripts/keyword-gap.py`'s hardcoded cert list, which claimed CompTIA Security+/CySA+/PenTest+, eJPT, ISC2 CC, and Wazuh Certified Engineer ? none of which are actually held ? replacing it with the real Cisco/IBM/Google cert set. Merged dependabot PR #27 (action-send-mail v3?v22, all CI green, no config changes needed ? nodemailer bumps and an unrelated proxy-var breaking change that doesn't apply here). Removed the stale `OWNER\_ORGS` self-skip filter from `cloudflare-worker/worker.js` (ISP org string no longer matched, so it silently did nothing) ? this fix still needs a manual `wrangler deploy`, since no CI workflow deploys the main worker and this session had no Cloudflare credentials to do it directly. Used the browser-automation skill to load the live site headless and click the real "Download Resume" link, confirming the full pipeline end-to-end for the first time: the click POSTed to `lingering-surf-6d77.workers.dev/visit` (200), which fired a `repository\_dispatch` that triggered `log-download.yml` successfully ? closing out the last unproven item from the 09-09 session. Confirmed via `gh run list` that `keyword-gap.yml` is still failing monthly (July/Aug/Sep) on a missing/invalid `ANTHROPIC\_API\_KEY`; no other workflow in the last 150 runs failed.
